

Chasmanthium latifolium in Pennsylvania

Critically Imperiled (S1)

- Declining populations
 - Habitat elimination
 - Agriculture, Industry, Housing
 - Damming of rivers
 - Alteration of flood patterns
 - Invasive species
- Disjunct populations
- Edge of range (northeastern edge)

Monongahela (West)

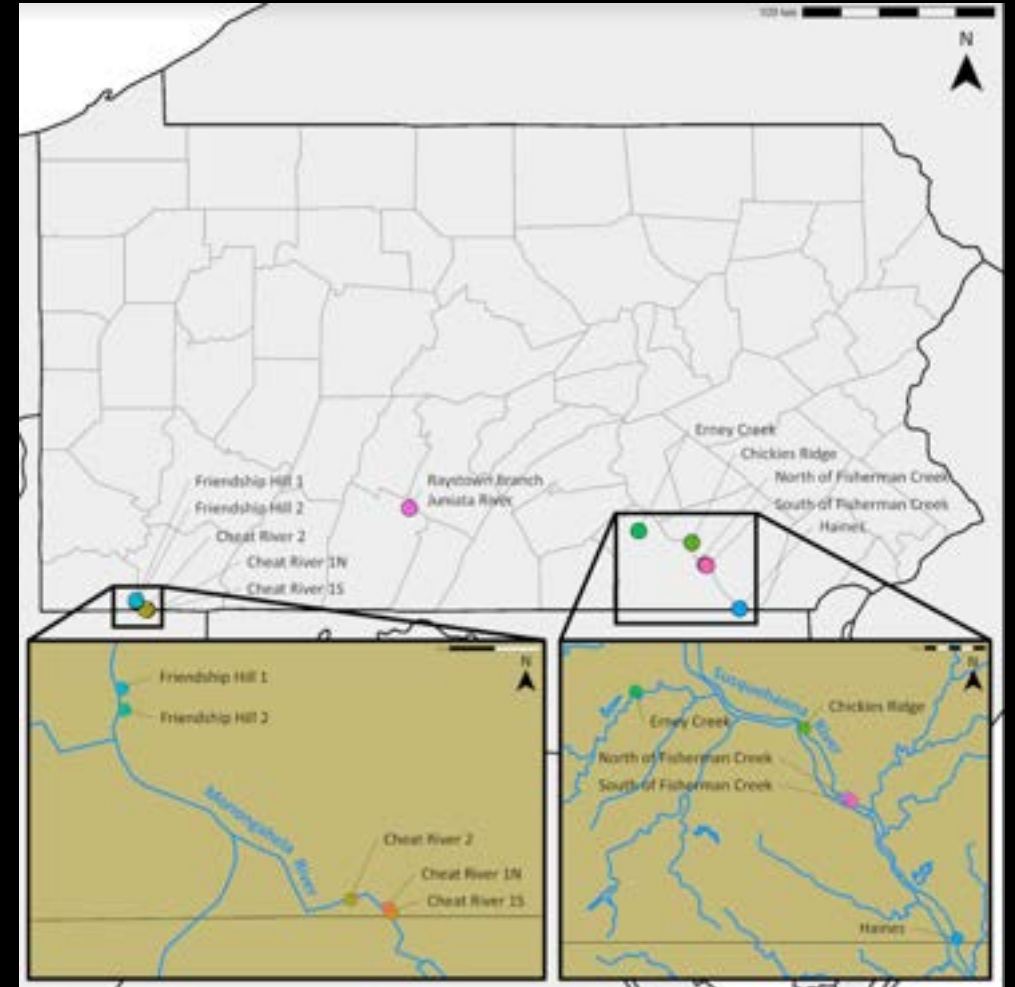

Juniata (Central)

Susquehanna (East)

Sample Collections

- Field collections (Scott, Rachel, Tanisha)
 - 11 populations
 - 7-16 individuals per populations
 - 155 individuals total

Methods

- DNA extraction
- Digestion: ApeKI enzyme
- Genotyping by sequencing (GBS)
- Illumina NovaSeq 6000
- Single nucleotide polymorphisms (SNPs)

Extraction, quantification, adding restriction enzyme, adaptors, and barcodes

Pooling samples and PCR

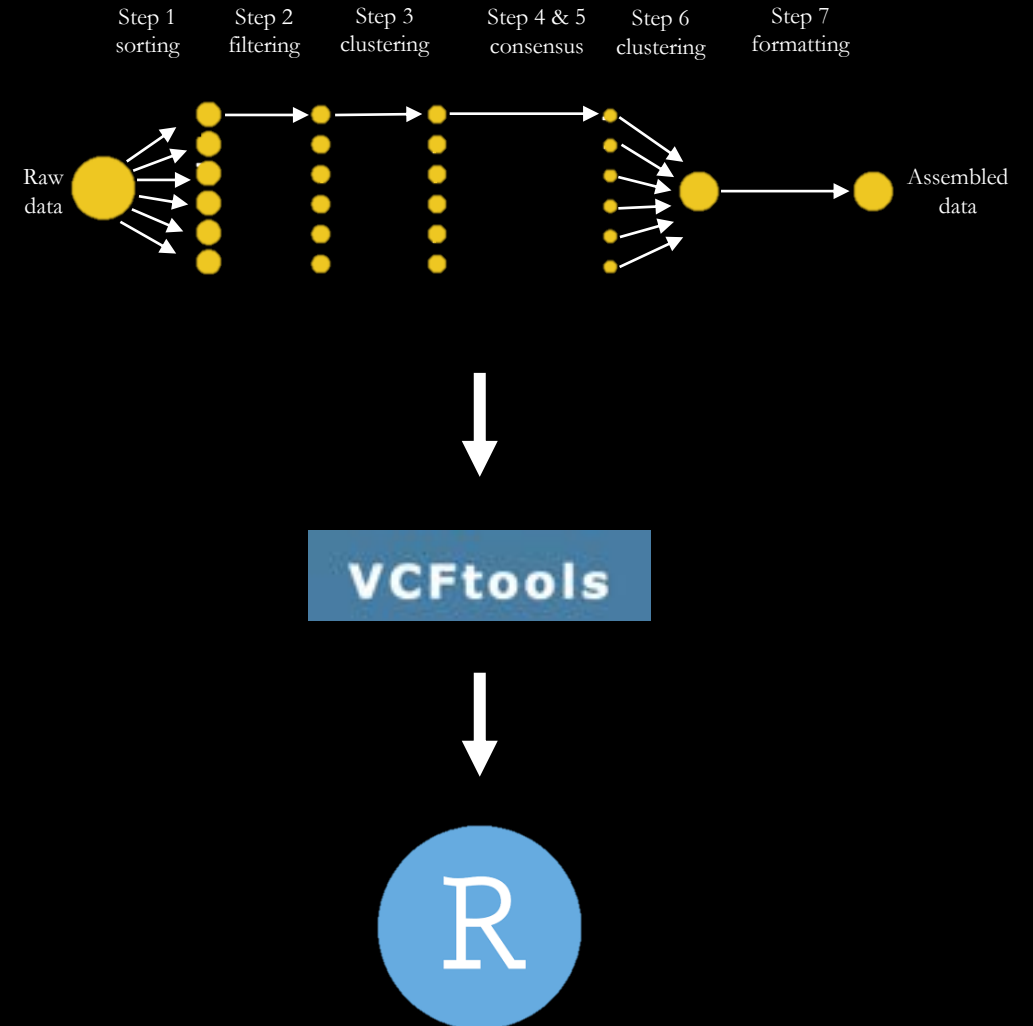

Sequencing

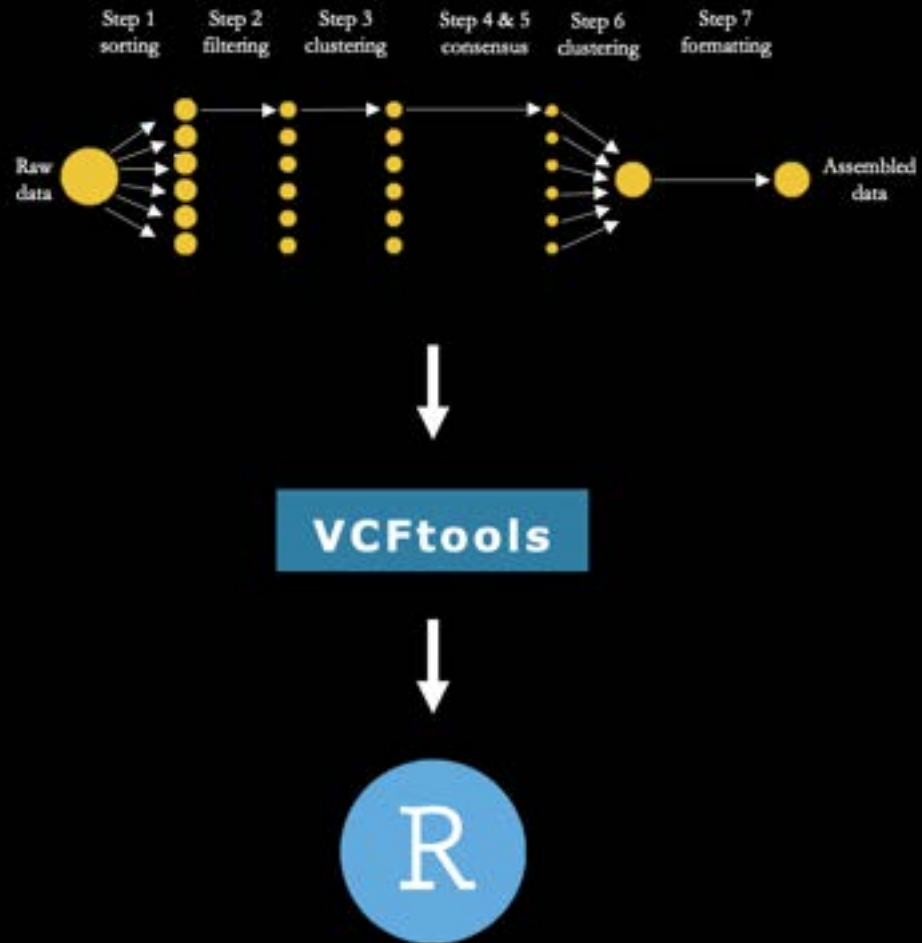

Methods

- Sequences assembled using ipyrad
- Hard Filtering: VCFtools
 - Removed samples with
 - <200,000 raw reads
 - Missingness $\geq 55\%$ of loci across 75% of samples
- All populations genetics analyses done in R

Methods

Dr. Angela McDonnell

Workshop on population and speciation genomics (Czech Republic)

Results

Results

- 133 individuals across 11 populations
- 2 million reads per sample (average)
- 1,000 loci
 - 1,998 SNPs

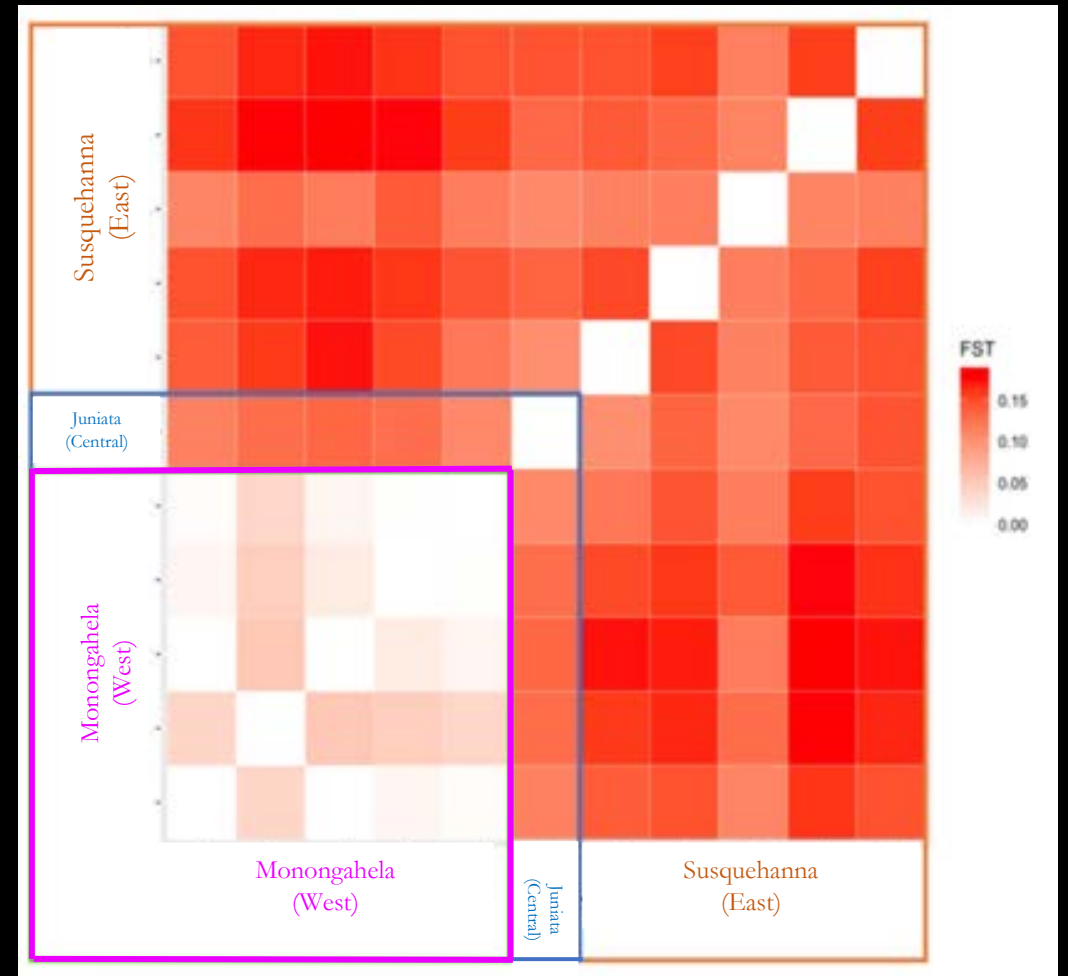

Results

- Overall F_{ST}
 - $F_{ST} = 0.1130$

Results

- Pairwise F_{ST}

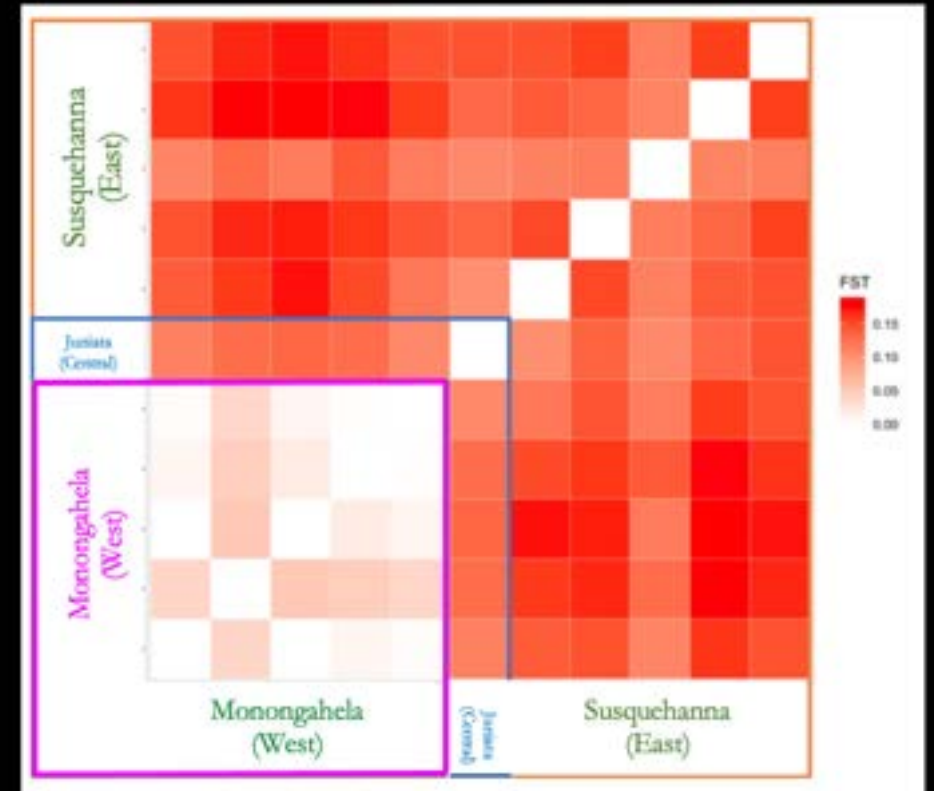

Results

- Pairwise F_{ST}
 - A lot of gene flow between western pops

Results

- Pairwise F_{ST}
 - A lot of gene flow between western pops
 - Very little gene flow between western and central-eastern

Results

- Pairwise F_{ST}
 - A lot of gene flow between western pops
 - Very little gene flow between western and central-eastern
 - Very little gene flow between central and eastern pops

Results

- Heterozygosity
 - Overall:
 - H_O : 0.6590
 - H_E : 0.3969
 - Every case $H_O > H_E$

Region	Population	H_O	H_E	Bartlett's K^2 <i>*p</i> < 2.2e ⁻¹⁶
Susquehanna (East)	Haines	0.7103	0.3837	421.6*
	North of Fisherman Run	0.7355	0.3944	457.0*
	South of Fisherman Run	0.5154	0.4097	372.1*
	Chickies Ridge	0.7388	0.3926	454.6*
	Erney Creek	0.7400	0.3985	482.0*
	Raystown Branch Juniata River	0.6440	0.4047	401.3*
Monongahela (West)	Cheat River 1N	0.6969	0.3958	423.1*
	Cheat River 1S	0.6212	0.4147	475.5*
	Cheat River 2	0.5507	0.3863	355.5*
	Friendship Hill 1	0.6847	0.3909	396.4*
	Friendship Hill 2	0.6119	0.4035	355.8*

Results

- Inbreeding (F_{IS})
 - Overall:
 - $F_{IS} = -0.6219$

Region	Population	F_{IS}	F_{IS} [95% CI]
Susquehanna (East)	Haines	-0.8512	[-0.8615, -0.8408]
	North of Fisherman Run	-0.8649	[-0.8754, -0.8526]
	South of Fisherman Run	-0.2580	[-0.2905, -0.2238]
	Chickies Ridge	-0.8817	[-0.8911, -0.8713]
	Erney Creek	-0.8569	[-0.8694, -0.8434]
Juniata (Central)	Raystown Branch Juniata River	-0.5915	[-0.6087, -0.5746]
Monongahela (West)	Cheat River 1N	-0.7608	[-0.7789, -0.7412]
	Cheat River 1S	-0.4978	[-0.5246, -0.4692]
	Cheat River 2	-0.4258	[-0.4577, -0.3963]
	Friendship Hill 1	-0.7517	[-0.7648, -0.7387]
	Friendship Hill 2	-0.5166	[-0.5360, -0.4976]

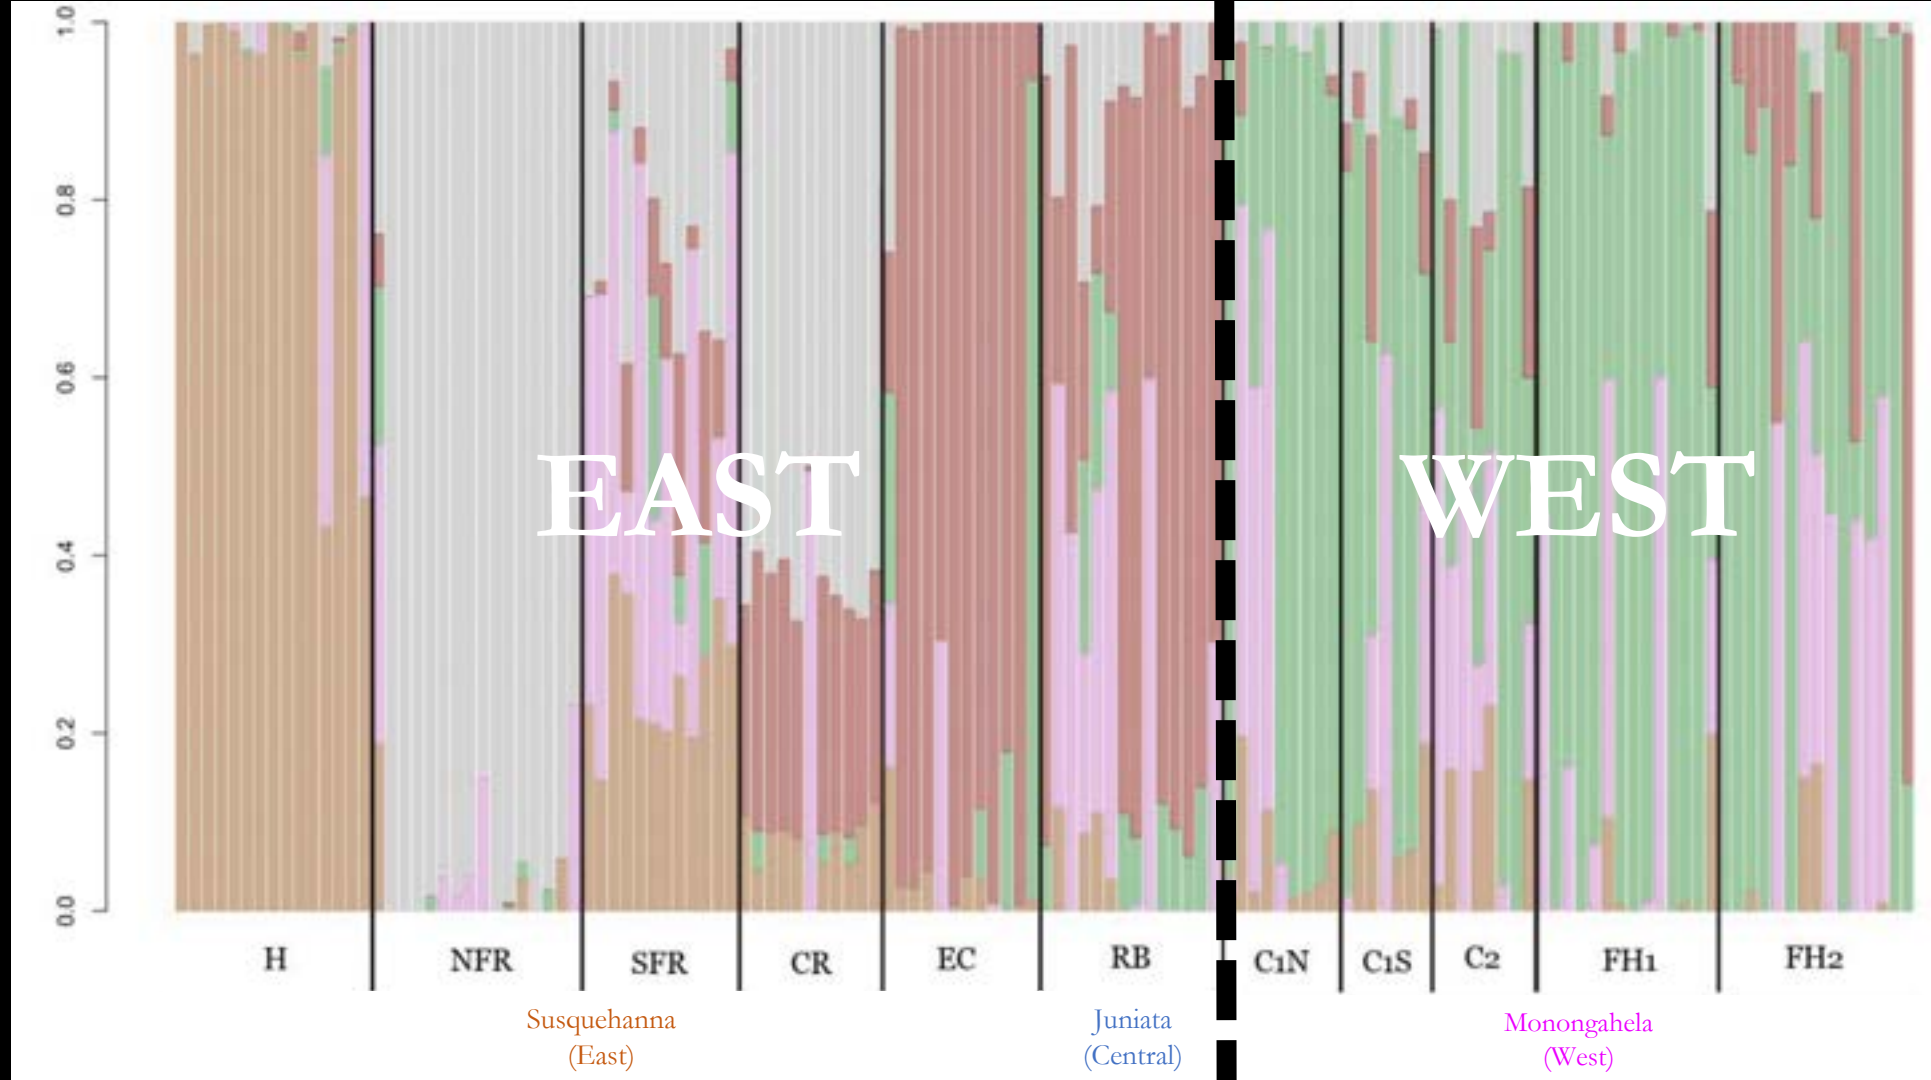

STRUCTURE Analysis

$K = 5$ ancestral clades

Eastern: Lots of genetic differentiation

Western: Genetically similar

Central: Clustering with EC

STRUCTURE Analysis

$K = 5$ ancestral clades

East-West Disjunction

Conclusions

- Currently, all populations are genetically healthy
- Western pops are genetically similar
- Eastern and central populations are genetically isolated from each other and western pops

Global F_{ST} : moderate
differentiation

F_{IS} :
no inbreeding is occurring

Pairwise F_{ST} :
high gene flow only in
western pops

Heterozygosity: higher than
expected

STRUCTURE & DAPC:
western pops similar, while generally central-
eastern pops are genetically different

Conservation Implications

Limited and declining state distribution

Populations appear to be massive and healthy

Western populations appear genetically secure, while eastern and central populations are of greater concern

Genetic diversity & connectivity of *Chasmanthium latifolium* (Poaceae) in Pennsylvania & the effect on conservation status of a rare species

Population Genomics and Climate Change Vulnerability of an Appalachian Endemic Plant in Pennsylvania

Research seeks to clarify the conservation and protection status of bog Jacob's ladder (*Polemonium vanbruntiae*), a species of conservation concern, using a combination of traditional herbarium and field-based assessments, modern population genetics methods and climate modeling. This will be a model for rare plant conservation work that uses comparative plant population genomic techniques and climate change modeling methods, in combination with traditional natural heritage methods.

Special Issue on Conservation

From Theory to Practice: New Innovations and Their Application in Conservation Biology

- Best practices
 - Novel conceptual frameworks
 - Software of database
 - Best practices for managing ex situ collections
 - New techniques to combat poaching
-
- Abstracts due April 4, 2023
